Canonical Cover

In the case of updating the database, the responsibility of the system is to check whether the existing functional dependencies are getting violated during the process of updating. In case of a violation of functional dependencies in the new database state, the rollback of the system must take place.

A canonical cover or irreducible a set of functional dependencies FD is a simplified set of FD that has a similar closure as the original set FD.

Extraneous attributes

An attribute of an FD is said to be extraneous if we can remove it without changing the closure of the set of FD.

Example: Given a relational Schema $R(A, B, C, D)$ and set of Function Dependency $FD = \{ B \rightarrow A, AD \rightarrow BC, C \rightarrow ABD \}$. Find the canonical cover?

Solution: Given $FD = \{ B \rightarrow A, AD \rightarrow BC, C \rightarrow ABD \}$, now decompose the FD using decomposition rule(Armstrong Axiom).

1. $B \rightarrow A$
2. $AD \rightarrow B$ (using decomposition inference rule)
3. $AD \rightarrow C$ (using decomposition inference rule)
4. $C \rightarrow A$ (using decomposition inference rule)
5. $C \rightarrow B$ (using decomposition inference rule)
6. $C \rightarrow D$ (using decomposition inference rule)

Now set of FD = { $B \rightarrow A$, $AD \rightarrow B$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

The next step is to find closure of the left side of each of the given FD by including that FD and excluding that FD, if closure in both cases are same then that FD is redundant and we remove that FD from the given set, otherwise if both the closures are different then we do not exclude that FD.

Calculating closure of all FD { $B \rightarrow A$, $AD \rightarrow B$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

1a. Closure $B^+ = BA$ using FD = { $B \rightarrow A$, $AD \rightarrow B$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

1b. Closure $B^+ = B$ using FD = { $AD \rightarrow B$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

From 1 a and 1 b, we found that both the Closure(by including $B \rightarrow A$ and excluding $B \rightarrow A$) are not equivalent, hence FD $B \rightarrow A$ is important and cannot be removed from the set of FD.

2 a. Closure $AD^+ = ADBC$ using FD = { $B \rightarrow A$, $AD \rightarrow B$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

2 b. Closure $AD^+ = ADCB$ using FD = { $B \rightarrow A$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

From 2 a and 2 b, we found that both the Closure (by including $AD \rightarrow B$ and excluding $AD \rightarrow B$) are equivalent, hence FD $AD \rightarrow B$ is not important and can be removed from the set of FD.

Hence resultant FD = { $B \rightarrow A$, $AD \rightarrow C$, $C \rightarrow A$, $C \rightarrow B$, $C \rightarrow D$ }

3 a. Closure $AD^+ = ADCB$ using FD = { $B \rightarrow A$, AD

3 b. Closure $AD^+ = AD$ using FD = { $B \rightarrow A$, $C \rightarrow$

From 3 a and 3 b, we found that both the Closure not equivalent, hence FD $AD \rightarrow C$ is important ar

Hence resultant FD = { $B \rightarrow A$, $AD \rightarrow C$, $C \rightarrow A$,

4 a. Closure $C^+ = CABD$ using $FD = \{ B \rightarrow A, AD \rightarrow C, \mathbf{C} \rightarrow \mathbf{A}, C \rightarrow B, C \rightarrow D \}$

4 b. Closure $C^+ = CBDA$ using $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$

From 4 a and 4 b, we found that both the Closure (by including $\mathbf{C} \rightarrow \mathbf{A}$ and excluding $\mathbf{C} \rightarrow \mathbf{A}$) are equivalent, hence $FD \mathbf{C} \rightarrow \mathbf{A}$ is not important and can be removed from the set of FD .

Hence resultant $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$

5 a. Closure $C^+ = CBDA$ using $FD = \{ B \rightarrow A, AD \rightarrow C, \mathbf{C} \rightarrow \mathbf{B}, C \rightarrow D \}$

5 b. Closure $C^+ = CD$ using $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow D \}$

From 5 a and 5 b, we found that both the Closure (by including $\mathbf{C} \rightarrow \mathbf{B}$ and excluding $\mathbf{C} \rightarrow \mathbf{B}$) are not equivalent, hence $FD \mathbf{C} \rightarrow \mathbf{B}$ is important and cannot be removed from the set of FD .

Hence resultant $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$

6 a. Closure $C^+ = CDBA$ using $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, \mathbf{C} \rightarrow \mathbf{D} \}$

6 b. Closure $C^+ = CBA$ using $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B \}$

From 6 a and 6 b, we found that both the Closure (by including $\mathbf{C} \rightarrow \mathbf{D}$ and excluding $\mathbf{C} \rightarrow \mathbf{D}$) are not equivalent, hence $FD \mathbf{C} \rightarrow \mathbf{D}$ is important and cannot be removed from the set of FD .

Hence resultant $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$

- Since $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$ is resultant FD , now we have checked the redundancy of attribute, since the left side of $FD \mathbf{AD} \rightarrow \mathbf{C}$ has two attributes, let's check their importance, i.e. whether they both are important or only one.

Closure $AD^+ = ADCB$ using $FD = \{ B \rightarrow A, \mathbf{AD} \rightarrow \mathbf{C}, C \rightarrow B, C \rightarrow D \}$

Closure $A^+ = A$ using $FD = \{ B \rightarrow A, \mathbf{AD} \rightarrow \mathbf{C}, C \rightarrow B, C \rightarrow D \}$

Closure $D^+ = D$ using $FD = \{ B \rightarrow A, \mathbf{AD} \rightarrow \mathbf{C}, C \rightarrow \}$

Since the closure of AD^+ , A^+ , D^+ that we found and D are important attributes and cannot be removed.

Hence resultant $FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$

$FD = \{ B \rightarrow A, AD \rightarrow C, C \rightarrow BD \}$ is Canonical C

Example 2: Given a relational Schema $R(W, X, Y, Z)$ and set of Function Dependency $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow WXY, WY \rightarrow Z \}$. Find the canonical cover?

Solution: Given $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow WXY, WY \rightarrow Z \}$, now decompose the FD using decomposition rule(Armstrong Axiom).

1. $W \rightarrow X$
2. $Y \rightarrow X$
3. $Z \rightarrow W$ (using decomposition inference rule on $Z \rightarrow WXY$)
4. $Z \rightarrow X$ (using decomposition inference rule on $Z \rightarrow WXY$)
5. $Z \rightarrow Y$ (using decomposition inference rule on $Z \rightarrow WXY$)
6. $WY \rightarrow Z$

Now set of $FD = \{ W \rightarrow X, Y \rightarrow X, WY \rightarrow Z, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y \}$

The next step is to find closure of the left side of each of the given FD by including that FD and excluding that FD, if closure in both cases are same then that FD is redundant and we remove that FD from the given set, otherwise if both the closures are different then we do not exclude that FD.

Calculating closure of all FD $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

1 a. Closure $W^+ = WX$ using $FD = \{ \mathbf{W} \rightarrow \mathbf{X}, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

1 b. Closure $W^+ = W$ using $FD = \{ Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

From 1 a and 1 b, we found that both the Closure (by including $\mathbf{W} \rightarrow \mathbf{X}$ and excluding $\mathbf{W} \rightarrow \mathbf{X}$) are not equivalent, hence FD $W \rightarrow X$ is important and cannot be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

2 a. Closure $Y^+ = YX$ using $FD = \{ W \rightarrow X, \mathbf{Y} \rightarrow \mathbf{X}, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

2 b. Closure $Y^+ = Y$ using $FD = \{ W \rightarrow X, Z \rightarrow W,$

From 2 a and 2 b we found that both the Closure are not equivalent, hence FD $Y \rightarrow X$ is important and cannot be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

3 a. Closure $Z^+ = ZWXY$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

3 b. Closure $Z^+ = ZXY$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

From 3 a and 3 b, we found that both the Closure (by including $Z \rightarrow W$ and excluding $Z \rightarrow W$) are not equivalent, hence FD $Z \rightarrow W$ is important and cannot be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

4 a. Closure $Z^+ = ZXWY$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow X, Z \rightarrow Y, WY \rightarrow Z \}$

4 b. Closure $Z^+ = ZWYX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

From 4 a and 4 b, we found that both the Closure (by including $Z \rightarrow X$ and excluding $Z \rightarrow X$) are equivalent, hence FD $Z \rightarrow X$ is **not** important and can be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

5 a. Closure $Z^+ = ZYWX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

5 b. Closure $Z^+ = ZWX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, WY \rightarrow Z \}$

From 5 a and 5 b, we found that both the Closure (by including $Z \rightarrow Y$ and excluding $Z \rightarrow Y$) are not equivalent, hence FD $Z \rightarrow X$ is important and cannot be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

6 a. Closure $WY^+ = WYZX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

6 b. Closure $WY^+ = WYX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y \}$

From 6 a and 6 b, we found that both the Closure (by including $WY \rightarrow Z$ and excluding $WY \rightarrow Z$) are not equivalent, hence FD $WY \rightarrow Z$ is important and cannot be removed from the set of FD.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

Since $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$ is resultant FD now, we have checked the ^(x) redundancy of attribute, since the left side of FD importance, i.e. whether they both are important

Closure $WY^+ = WYZX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

Closure $W^+ = WX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

Closure $Y^+ = YX$ using $FD = \{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$

Since the closure of WY^+ , W^+ , Y^+ that we found are not all equivalent, hence in FD $WY \rightarrow Z$, both W and Y are important attributes and cannot be removed.

Hence resultant FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow W, Z \rightarrow Y, WY \rightarrow Z \}$ and we can rewrite as:

FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow WY, WY \rightarrow Z \}$ is Canonical Cover of FD = $\{ W \rightarrow X, Y \rightarrow X, Z \rightarrow WXY, WY \rightarrow Z \}$.

Example 3: Given a relational Schema $R(V, W, X, Y, Z)$ and set of Function Dependency FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow VXZ \}$. Find the canonical cover?

Solution: Given FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow VXZ \}$. now decompose the FD using decomposition rule (Armstrong Axiom).

1. $V \rightarrow W$
2. $VW \rightarrow X$
3. $Y \rightarrow V$ (using decomposition inference rule on $Y \rightarrow VXZ$)
4. $Y \rightarrow X$ (using decomposition inference rule on $Y \rightarrow VXZ$)
5. $Y \rightarrow Z$ (using decomposition inference rule on $Y \rightarrow VXZ$)

Now set of FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$.

The next step is to find closure of the left side of each of the given FD by including that FD and excluding that FD, if closure in both cases are same then that FD is redundant and we remove that FD from the given set, otherwise if both the closures are different then we do not exclude that FD.

Calculating closure of all FD $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$.

1 a. Closure $V^+ = VWX$ using FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$

1 b. Closure $V^+ = V$ using FD = $\{ VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$

From 1 a and 1 b, we found that both the Closures are not equivalent, hence FD $V \rightarrow W$ is important and cannot be removed.

Hence resultant FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V$

2 a. Closure $VW^+ = VWX$ using FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V \}$

2 b. Closure $VW^+ = VW$ using FD = $\{ V \rightarrow W, Y \rightarrow V \}$

From 2 a and 2 b, we found that both the Closure(by including **VW** → **X** and excluding **VW** → **X**) are not equivalent, hence FD **VW** → **X** is important and cannot be removed from the set of FD.

Hence resultant FD = { V → W, VW → X, Y → V, Y → X, Y → Z }.

3 a. Closure $Y^+ = YVXZW$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$

3 b. Closure $Y^+ = YXZ$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow X, Y \rightarrow Z \}$

From 3 a and 3 b, we found that both the Closure(by including **Y** → **V** and excluding **Y** → **V**) are not equivalent, hence FD **Y** → **V** is important and cannot be removed from the set of FD.

Hence resultant FD = { V → W, VW → X, Y → V, Y → X, Y → Z }.

4 a. Closure $Y^+ = YXVZW$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow X, Y \rightarrow Z \}$

4 b. Closure $Y^+ = YVZWX$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow Z \}$

From 4 a and 4 b, we found that both the Closure(by including **Y** → **X** and excluding **Y** → **X**) are equivalent, hence FD **Y** → **X** is **not** important and can be removed from the set of FD.

Hence resultant FD = { V → W, VW → X, Y → V, Y → Z }.

5 a. Closure $Y^+ = YZVWX$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow Z \}$

5 b. Closure $Y^+ = YVWX$ using $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V \}$

From 5 a and 5 b, we found that both the Closure(by including **Y** → **Z** and excluding **Y** → **Z**) are not equivalent, hence FD **Y** → **Z** is important and cannot be removed from the set of FD.

Hence resultant FD = { V → W, VW → X, Y → V, Y → Z }.

Since $FD = \{ V \rightarrow W, VW \rightarrow X, Y \rightarrow V, Y \rightarrow Z \}$ is resultant FD now, we have checked the redundancy of attribute, since the left side of FD **VW** → **X** has two attributes at its left, let's check their importance ^(x) i.e. whether they both are important or only one.

Closure $VW^+ = VWX$ using $FD = \{ V \rightarrow W, VW \rightarrow X \}$

Closure $V^+ = VWX$ using $FD = \{ V \rightarrow W, VW \rightarrow X \}$

Closure $W^+ = W$ using $FD = \{ V \rightarrow W, VW \rightarrow X \}$

Since the closure of VW^+ , V^+ , W^+ we found that in FD **VW** → **X**, **W** is not at all an important attribute.

Hence resultant FD = $\{ V \rightarrow W, V \rightarrow X, Y \rightarrow V, Y \rightarrow Z \}$ and we can rewrite as

FD = $\{ V \rightarrow WX, Y \rightarrow VZ \}$ is Canonical Cover of FD = $\{ V \rightarrow W, VW \rightarrow X, Y \rightarrow VXZ \}$.

CONCLUSION: From the above three examples we conclude that canonical cover / irreducible set of functional dependency follows the following steps, which we need to follow while calculating Canonical Cover.

STEP 1: For a given set of FD, decompose each FD using decomposition rule (Armstrong Axiom) if the right side of any FD has more than one attribute.

STEP 2: Now make a new set of FD having all decomposed FD.

STEP 3: Find closure of the left side of each of the given FD by including that FD and excluding that FD, if closure in both cases are same then that FD is redundant and we remove that FD from the given set, otherwise if both the closures are different then we do not exclude that FD.

STEP 4: Repeat step 4 till all the FDs in FD set are complete.

STEP 5: After STEP 4, find resultant FD = $\{ B \rightarrow A, AD \rightarrow C, C \rightarrow B, C \rightarrow D \}$ which are not redundant.

STEP 6: Check redundancy of attribute, by selecting those FD's from FD sets which are having more than one attribute on its left, let's an FD $AD \rightarrow C$ has two attributes at its left, let's check their importance, i.e. whether they both are important or only one.

STEP 6 a: Find Closure AD^+

STEP 6 b: Find Closure A^+

STEP 6 c: Find Closure D^+

Compare Closure of STEP (6a, 6b, 6c) if the closure of AD^+ , A^+ , D^+ are not equivalent, hence in FD $AD \rightarrow C$, both A and D are important attributes and cannot be removed, otherwise, we remove the redundant attribute. ⊗
